

SYSTEM HARDENING

Provisioning and Hardening Two Digital Ocean Droplets with DISA STIGs
Using Ansible Automation Tool

Scope of Work

PROJECT SCOPE OVERVIEW

The purpose of this project is to provision and harden two Ubuntu Linux virtual machines hosted in the DigitalOcean cloud using Ansible automation and DISA Security Technical Implementation Guide (STIG) principles. The project focuses on implementing automated system hardening to ensure consistent, repeatable, and secure configurations across multiple cloud-based systems.

The scope of the project includes the creation of two identical DigitalOcean droplets running Ubuntu Linux and the configuration of an Ansible control node used to remotely manage and enforce security policies on the target systems. Secure communication between the control node and the target droplets is established using SSH key-based authentication. Ansible is utilized to automate the application of security controls, eliminating manual configuration and reducing the risk of configuration drift.

As part of the hardening process, a total of twenty DISA STIG-aligned security controls are implemented and categorized by risk severity, including five Category I (High), five Category II (Medium), and ten Category III (Low) controls. These controls address areas such as SSH hardening, firewall enforcement, auditing, time synchronization, kernel network protections, file permission enforcement, and system update management.

The success of the project is measured by the successful execution of Ansible playbooks, validation of applied configurations using command-line verification, and confirmation that both target systems reach an identical hardened security posture. The project is designed to be achievable using open-source tools, realistic within the assigned milestone timeline, and aligned with industry-recognized security compliance practices.

NETWORK TOPOLOGY DIAGRAM WITH IP ADDRESSES

CLOUD AUTOMATION PROCEDURAL INSTRUCTIONS

Step 1: Provision Ubuntu Droplets in DigitalOcean

1. Log in to the DigitalOcean control panel.
2. Create two new droplets using identical configurations:
 - Operating System: Ubuntu Linux (LTS version)
 - Droplet size: Basic plan
 - Region: Same region for both droplets
3. Assign the following hostnames:
 - stig-target-01
 - stig-target-02
4. Enable SSH key authentication during droplet creation.
5. Complete the provisioning process and verify both droplets are running.
6. Record the public IP addresses assigned to each droplet for later use.

Step 2: Prepare the Ansible Control Node

1. Provision a separate Ubuntu Linux droplet to act as the Ansible control node.
2. Log in to the control node via SSH.
3. Update and upgrade the operating system packages.
4. Install Ansible and required dependencies.
5. Verify the installation by checking the Ansible version.

```
user@kwaldenuser: ~  
user@kwaldenuser:~$ ansible --version  
ansible [core 2.16.3]  
  config file = None  
  configured module search path = ['/home/user/.ansible/plugins/modules', '/usr/share/ansible/plugins/modules']  
  ansible python module location = /usr/lib/python3/dist-packages/ansible  
  ansible collection location = /home/user/.ansible/collections:/usr/share/ansible/collections  
  executable location = /usr/bin/ansible  
  python version = 3.12.3 (main, Nov  6 2025, 13:44:16) [GCC 13.3.0] (/usr/bin/python3)  
  jinja version = 3.1.2  
  libyaml = True  
user@kwaldenuser:~$ |
```

Step 3: Generate and Configure SSH Key Authentication

1. On the Ansible control node, generate an SSH key pair.
2. Ensure the public key is associated with both target droplets in DigitalOcean.
3. Test SSH connectivity from the control node to each target droplet using the root account.

Successful SSH access confirms secure communication between the control node and target systems.

Step 4: Create the Ansible Inventory File

1. On the control node, create an Ansible inventory file.
2. Define both target systems using hostnames mapped to their IP addresses.
3. Specify SSH key usage and remote user configuration.
4. Group both targets under a single host group to support uniform automation.

```
GNU nano 7.2 /home/user/ansible/inventory/hosts.ini
[stig_targets]
stig-target-01 ansible_host=146.190.132.124
stig-target-02 ansible_host=137.184.36.19

[stig_targets:vars]
ansible_user=root
ansible_ssh_private_key_file=~/.ssh/id_ed25519
```

Terminal window title: user@kwaldenuser: ~

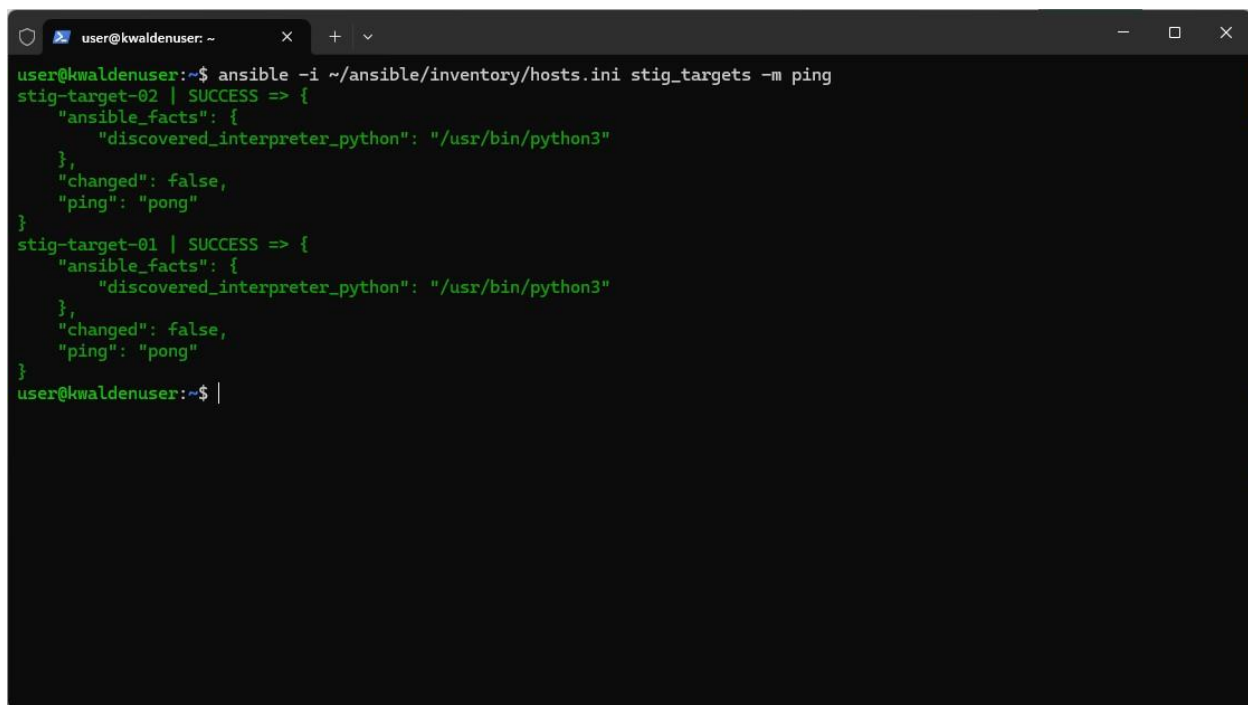

Footer: [Read 7 lines]

Help: ^G Help, ^X Exit, ^O Write Out, ^R Read File, ^W Where Is, ^\ Replace, ^K Cut, ^U Paste, ^T Execute, ^J Justify, ^C Location, ^/ Go To Line, M-U Undo, M-E Redo, M-A Set Mark, M-6 Copy

Step 5: Validate Ansible Connectivity

1. Use the Ansible ping module to test connectivity to both target systems.
2. Confirm both systems return a successful response.
3. Resolve any SSH or inventory parsing issues before proceeding.

Successful validation confirms Ansible can communicate with both systems.

A terminal window with a dark background and light green text. The window title is 'user@kwaldenuser: ~'. The command entered is 'ansible -i ~/ansible/inventory/hosts.ini stig_targets -m ping'. The output shows the results for two targets: stig-target-02 and stig-target-01. Both show 'SUCCESS' and 'ping: pong'. The JSON output for stig-target-02 is: {"ansible_facts": {"discovered_interpreter_python": "/usr/bin/python3"}, "changed": false, "ping": "pong"}. The output for stig-target-01 is similar but with a different path for the interpreter. The prompt 'user@kwaldenuser:~\$' is visible at the bottom.

```
user@kwaldenuser:~$ ansible -i ~/ansible/inventory/hosts.ini stig_targets -m ping
stig-target-02 | SUCCESS => {
  "ansible_facts": {
    "discovered_interpreter_python": "/usr/bin/python3"
  },
  "changed": false,
  "ping": "pong"
}
stig-target-01 | SUCCESS => {
  "ansible_facts": {
    "discovered_interpreter_python": "/usr/bin/python3"
  },
  "changed": false,
  "ping": "pong"
}
user@kwaldenuser:~$
```

Step 6: Execute DISA STIG Hardening Playbook

1. Develop an Ansible playbook containing DISA STIG-aligned security controls.
2. Categorize controls by severity: Category I, Category II, and Category III.
3. Execute the playbook against both target systems simultaneously.
4. Monitor playbook execution to ensure no tasks fail.

The playbook applies all security configurations automatically and consistently across both systems.

```
user@kwaldenuser: ~  
TASK [CAT III-16 | Enable automatic security updates] *****  
ok: [stig-target-02]  
ok: [stig-target-01]  
  
TASK [CAT III-17 | Secure SSH config permissions] *****  
changed: [stig-target-01]  
changed: [stig-target-02]  
  
TASK [CAT III-18 | Secure /etc/passwd permissions] *****  
ok: [stig-target-02]  
ok: [stig-target-01]  
  
TASK [CAT III-19 | Secure /etc/shadow permissions] *****  
changed: [stig-target-02]  
changed: [stig-target-01]  
  
TASK [CAT III-20 | Disable Ctrl-Alt-Del reboot] *****  
ok: [stig-target-02]  
ok: [stig-target-01]  
  
TASK [Restart SSH service] *****  
changed: [stig-target-02]  
changed: [stig-target-01]  
  
PLAY RECAP *****  
stig-target-01      : ok=29   changed=21   unreachable=0    failed=0    skipped=0    rescued=0    ignored=0  
stig-target-02      : ok=29   changed=21   unreachable=0    failed=0    skipped=0    rescued=0    ignored=0  
user@kwaldenuser:~$ |
```

Step 8: Document Results and Errors

1. Capture screenshots of all successful validation steps.
2. Document any errors encountered during automation or validation.
3. Record error causes and solutions in Appendix A.
4. Update Appendix B with the list of implemented DISA STIGs and risk categories.

FINAL SCRIPT

- name: Apply DISA STIG-aligned hardening (20 controls)

hosts: stig_targets

become: true

vars:

sshd_config: /etc/ssh/sshd_config

tasks:

#####

CATEGORY I — HIGH (5)

#####

- name: CAT I-01 | Disable SSH root login

lineinfile:

path: "{{ sshd_config }}"

regexp: '^#?PermitRootLogin'

line: 'PermitRootLogin no'

- name: CAT I-02 | Disable SSH password authentication

lineinfile:

path: "{{ sshd_config }}"

regexp: '^#?PasswordAuthentication'

line: 'PasswordAuthentication no'

- name: CAT I-03 | Disable empty passwords

lineinfile:

path: "{{ sshd_config }}"

regexp: '^#?PermitEmptyPasswords'

line: 'PermitEmptyPasswords no'

- name: CAT I-04 | Install and configure UFW firewall

apt:

name: ufw

- name: CAT I-04 | Configure firewall defaults

community.general.ufw:

direction: incoming

policy: deny

- name: CAT I-04 | Allow SSH through firewall

community.general.ufw:

rule: allow

name: OpenSSH

- name: CAT I-04 | Enable firewall

community.general.ufw:

state: enabled

- name: CAT I-05 | Install and enable auditd

apt:

name:

- auditd

- audispd-plugins

state: present

- service:

name: auditd

state: started

enabled: true

#####

CATEGORY II — MEDIUM (5)

#####

- name: CAT II-06 | Enforce SSH idle timeout

lineinfile:

path: "{{ sshd_config }}"

regexp: '^#?ClientAliveInterval'

line: 'ClientAliveInterval 300'

- name: CAT II-07 | Enforce SSH protocol 2

lineinfile:

path: "{{ sshd_config }}"

regexp: '^#?Protocol'

line: 'Protocol 2'

- name: CAT II-08 | Enforce password aging policies

lineinfile:

path: /etc/login.defs

regexp: '^PASS_MAX_DAYS'

line: 'PASS_MAX_DAYS 60'

- lineinfile:

path: /etc/login.defs

regexp: '^PASS_MIN_DAYS'

line: 'PASS_MIN_DAYS 1'

- lineinfile:

path: /etc/login.defs

regexp: '^PASS_WARN_AGE'

line: 'PASS_WARN_AGE 7'

- name: CAT II-09 | Install and enable chrony

apt:

name: chrony

state: present

- service:

name: chrony

state: started

enabled: true

- name: CAT II-10 | Disable unused filesystems

copy:

dest: /etc/modprobe.d/stig-filesystems.conf

content: |

install cramfs /bin/true

install squashfs /bin/true

#####

CATEGORY III — LOW (10)

#####

- name: CAT III-11 | Disable ICMP redirects

sysctl:

name: net.ipv4.conf.all.accept_redirects

value: '0'

state: present

reload: yes

- name: CAT III-12 | Disable source routing

sysctl:

name: net.ipv4.conf.all.accept_source_route

value: '0'

state: present

reload: yes

- name: CAT III-13 | Enable TCP SYN cookies

sysctl:

name: net.ipv4.tcp_syncookies

value: '1'

state: present

reload: yes

- name: CAT III-14 | Restrict core dumps

lineinfile:

path: /etc/security/limits.conf

line: '* hard core 0'

- name: CAT III-15 | Set secure default umask

lineinfile:

path: /etc/profile

regexp: '^umask'

line: 'umask 027'

- name: CAT III-16 | Enable automatic security updates

apt:

name: unattended-upgrades

state: present

- name: CAT III-17 | Secure SSH config permissions

file:

path: "{{ sshd_config }}"

owner: root

group: root

mode: '0600'

- name: CAT III-18 | Secure /etc/passwd permissions

file:

path: /etc/passwd

owner: root

group: root

mode: '0644'

- name: CAT III-19 | Secure /etc/shadow permissions

file:

path: /etc/shadow

owner: root

group: root

mode: '0640'

- name: CAT III-20 | Disable Ctrl-Alt-Del reboot

file:

path: /etc/systemd/system/ctrl-alt-del.target

state: absent

- name: Restart SSH service

service:

name: ssh

state: restarted

LESSONS LEARNED

One of the most significant lessons learned from this project was the value of automation in maintaining consistency and security across multiple systems. Manually configuring security settings on individual servers can easily lead to configuration drift, human error, or overlooked controls. By using Ansible, I was able to enforce the same security baseline across two cloud-hosted systems with a single execution, ensuring identical outcomes. This reinforced the importance of infrastructure-as-code principles in modern system administration and security operations. The project also highlighted how automation improves efficiency by reducing repetitive tasks and allowing administrators to focus on validation and analysis rather than manual configuration. Another key takeaway was understanding how automation tools rely heavily on proper initial setup, particularly SSH authentication and inventory configuration. Small misconfigurations in these foundational areas can prevent automation from functioning entirely. Troubleshooting these issues strengthened my understanding of how Ansible communicates with remote systems. Overall, this project demonstrated that automation is not only a convenience but a critical component of secure and scalable infrastructure management.

Another important lesson was the practical application of DISA STIGs in a real-world environment. Prior to this project, STIGs were primarily theoretical guidelines; implementing them revealed how they translate into concrete system configurations. Categorizing controls into Category I, II, and III emphasized how risk severity influences prioritization during system hardening. The project also demonstrated that STIG compliance is not about blindly applying settings, but about understanding the security intent behind each control. Mapping STIG identification numbers to actual system changes required careful attention to detail and reinforced the importance of documentation in compliance-driven environments. Additionally, applying STIGs on Ubuntu Linux highlighted the need to adapt compliance frameworks to different operating systems while maintaining their security objectives. This process improved my ability to interpret security requirements rather than treating them as rigid checklists. The experience reinforced that compliance and security are closely linked, but effective implementation requires both technical skill and analytical reasoning. These insights are directly applicable to roles in cybersecurity, system administration, and cloud security engineering.

The project also provided valuable experience in troubleshooting and problem-solving within a cloud-based environment. Several issues were encountered during the setup and validation phases, including SSH authentication failures, incorrect user assumptions, host key verification errors, and Ansible inventory parsing warnings. Resolving these issues required methodical analysis rather than trial-and-error, reinforcing the importance of understanding system behavior at a deeper level. The use of DigitalOcean's console access as a recovery method demonstrated the importance of having fallback access mechanisms when security controls restrict normal administrative access. Additionally, documenting each error and its resolution emphasized the role of clear documentation in long-term system maintenance and knowledge transfer. This process improved my confidence in diagnosing and resolving infrastructure issues under realistic conditions. The project also strengthened my ability to communicate technical challenges and solutions clearly through written documentation. Overall, these lessons reinforced that successful system hardening involves not only applying security controls but also understanding how to recover, validate, and document changes effectively. These skills are essential for working in professional IT and security environments where reliability, accountability, and clarity are critical.

APPENDIX A | DOCUMENT ERRORS & SOLUTIONS

Every time you receive an error while testing your script, take a screenshot of the error, paste it here, explain the error and document how you fixed it. Example:

1 - Error Title: STIG 02 unreachable

```
user@kwaldenuser: ~  
# Host 146.190.132.124 found: line 6  
/home/user/.ssh/known_hosts updated.  
Original contents retained as /home/user/.ssh/known_hosts.old  
# Host 137.184.36.19 found: line 1  
# Host 137.184.36.19 found: line 2  
# Host 137.184.36.19 found: line 3  
/home/user/.ssh/known_hosts updated.  
Original contents retained as /home/user/.ssh/known_hosts.old  
user@kwaldenuser:~$ ansible -i ~/ansible/inventory/hosts.ini stig_targets -m ping  
The authenticity of host '146.190.132.124 (146.190.132.124)' can't be established.  
ED25519 key fingerprint is SHA256:d2qLFfBLzCcGurGvtDKHeeMY4i7P4sT2kCv+FUzUJII.  
This key is not known by any other names.  
The authenticity of host '137.184.36.19 (137.184.36.19)' can't be established.  
ED25519 key fingerprint is SHA256:E86RK3PHYNeQIU8f0mTUiVFkQktIEpCFXB7YWd8h5Q.  
This key is not known by any other names.  
Are you sure you want to continue connecting (yes/no/[fingerprint])? yes  
stig-target-01 | SUCCESS => {  
  "ansible_facts": {  
    "discovered_interpreter_python": "/usr/bin/python3"  
  },  
  "changed": false,  
  "ping": "pong"  
}  
  
stig-target-02 | UNREACHABLE! => {  
  "changed": false,  
  "msg": "Failed to connect to the host via ssh: Host key verification failed",  
  "unreachable": true  
}  
user@kwaldenuser:~$ |
```

Error explanation: The system saw multiple host keys and was detecting a mismatch and refused to trust the host automatically.

Solution: I manually SSH into the droplet with `ssh root@137.184.36.19` verified I wanted to continue connecting and logged in successfully.

APPENDIX B | DISA STIGS LIST

List all the STIGs, and the risk category and a brief description of each. See example below.

STIG #	Risk Category	Description
UBTU-22-010040	(Cat 1)	Disable SSH root login
UBTU-22-010060	(Cat 1)	Disable SSH password authentication
UBTU-22-010070	(Cat 1)	Disable empty passwords
UBTU-22-010120	(Cat 1)	Enforce firewall default deny
UBTU-22-030020	(Cat 1)	Enable system auditing
UBTU-22-010090	(Cat 2)	Enforce SSH idle timeout
UBTU-22-010050	(Cat 2)	Enforce SSH protocol 2
UBTU-22-010230	(Cat 2)	Enforce password aging
UBTU-22-020030	(Cat 2)	Enable time synchronization
UBTU-22-010400	(Cat 2)	Disable unused filesystems
UBTU-22-040210	(Cat 3)	Disable ICMP redirects
UBTU-22-040220	(Cat 3)	Disable IP source routing
UBTU-22-040260	(Cat 3)	Enable TCP SYN cookies

UBTU-22-010310	(Cat 3)	Restrict core dumps
UBTU-22-010340	(Cat 3)	Enforce secure default umask
UBTU-22-020080	(Cat 3)	Enable automatic security updates
UBTU-22-010460	(Cat 3)	Secure SSH config permissions
UBTU-22-010450	(Cat 3)	Secure /etc/passwd permissions
UBTU-22-010460	(Cat 3)	Secure /etc/shadow permissions
UBTU-22-020320	(Cat 3)	Disable Ctrl-Alt-Del reboot
